

## # Git & GitHub Notes

### ## Basic Concepts

- Git is a Version Control System that tracks changes in files
- Repository (Repo): A folder tracked by Git that contains your project files
- The repository contains a hidden '.git' folder with configuration, objects, and other Git-related information

### ## Basic Git Workflow

1. Working Directory: Where you make changes to files
2. Staging Area: Files ready to be committed
3. Repository: Where Git stores the commit history

### ## Essential Git Commands

#### ### Setup and Configuration

```
```bash
```

```
# Initialize a new Git repository
```

```
git init
```

```
# Configure Git globally
```

```
git config --global user.name "Your Name"
```

```
git config --global user.editor "preferred_editor"
```

```
```
```

#### ### Basic Operations

```
```bash
```

```
# Check repository status
```

```
git status
```

```
# Add files to staging area
```

```
git add filename.txt
git add . # Add all files
```

```
# Commit changes
git commit -m "commit message"
```

```
# View commit history
git log --oneline # Condensed view
...
```

### ### Branches

```
```bash
# Create a new branch
git branch branch-name
git checkout -b branch-name # Create and switch to new branch
```

```
# Switch branches
git checkout branch-name
git switch branch-name # Modern alternative
```

```
# List branches
git branch # Local branches
git branch -r # Remote branches
```

```
# Merge branches
git merge branch-name
...
```

### ### Working with Remote Repositories

```
```bash
```

```
# Add remote repository
```

```
git remote add origin repository-url
```

```
# Push changes
```

```
git push origin branch-name
```

```
# Pull changes
```

```
git pull
```

```
git fetch # Fetch without merging
```

```
```
```

## ## Best Practices

### ### Commit Guidelines

- Follow "Atomic Commits" principle: one commit per logical change
- Keep commits focused on one feature, component, or fix
- Write commit messages in present tense
- Make commit messages descriptive and specific

### ### Collaboration Workflow

1. Create a branch for new features/fixes
2. Make changes and commit regularly
3. Push changes to remote repository
4. Create Pull Request (PR) for review
5. Address feedback and iterate
6. Merge changes after approval

## ## Advanced Git Commands

### ### Stashing

```
```bash
```

```
# Save changes temporarily
```

```
git stash
```

```
# Apply stashed changes
```

```
git stash apply
```

```
git stash pop # Apply and remove from stash
```

```
```
```

```
### Comparing Changes
```

```
```bash
```

```
# View differences
```

```
git diff # Between working directory and staging
```

```
git diff branch1 branch2 # Between branches
```

```
```
```

```
### Rebasing
```

```
- Alternative to merging
```

```
- Creates linear history
```

```
```bash
```

```
git rebase main
```

```
```
```

```
## GitHub Specific
```

```
### SSH Setup
```

```
- Generate SSH key to connect to GitHub
```

```
- Add SSH key to GitHub account settings
```

```
### Contributing to Open Source
```

```
1. Fork the repository
```

2. Create feature branch
3. Make changes
4. Open Pull Request
5. Be patient and responsive to feedback
6. Follow project contribution guidelines

### ### Best Practices

- Always pull before pushing new changes
- Keep local repository updated
- Use meaningful branch names
- Write clear PR descriptions
- Be responsive to review comments
